Argus Secure Service Edge - Powered by Zscaler

Zscaler and mnemonic - protecting your data and hybrid workforce
Mobile users now access applications from anywhere, leaving legacy network security more or less obsolete. The need for flexible cloud security controls is more relevant than ever. Zscaler's cloud delivered SaaS service is now seamlessly integrated with mnemonic Argus MDR services, and complements the service' ability to detect and respond to security incidents. The MDR services combined with 24/7 operations of the service gives you a cost-efficient managed service with best-in-class protection, for all your users, devices and apps.

With Zscaler Internet Access (ZIA) all internet traffic from your users, devices and workloads anywhere is inspected to stop malware, ransomware and advanced attacks. ZIA is a cloud native SaaS service, recognised by Gartner as the leading Secure Service Edge provider, featuring full inspection capabilities and unrivaled security. Zscaler Private Access (ZPA) provides zero-trust network access to all of your applications, regardless if they run in the public cloud or within your datacenter. ZPA ensures applications are kept completely hidden to unauthorized users. All this combined with extensive possibilities for data access and protection at any location and device.

mnemonic is your trusted security partner to validate and align change requests with company policy, continuously monitor services and to handle incidents. The integration with Argus MDR services opens for threat indicator sharing and semi-automated handling of security incidents.

About mnemonic
mnemonic has over 20 years of experience working with different security technologies. We provide 24x7 operations and support for security devices and services for numerous organizations. The mnemonic Argus Security Operations service is tailored to ensure our customers security solutions and cloud security services are optimized and maintained by our team of product and operations experts.
